

# Azure DNS & NSG to VM

Here, we add Azure Network Security groups and a Domain Name Label to our VM from #004.

Goal is to see the default *debian* screen of *nginx* on port 80 (http) under  
<your\_domain\_label>.<location>.cloudapp.azure.com

Most things are hardwired. Output is your public IP and your FQDN.

Things you should change:

azurerm_resource_group.location	Your location
azurerm_linux_virtual_machine	<i>Standard_&lt;cheapest_SKU&gt;</i>
azurerm_public_ip.domain_name_label	<1st_part_of_your_dns_name>
